

PACIFIC INC

B2B TILES DISTRIBUTION

Business Automation & Dealer Distribution System

Business Requirement & Technical Solution Document

Detailed Development & Implementation Guide (Frappe / ERPNext)

Client	Pacific Inc
Business Owner	Mr. Prashanth Bhupendra
Prepared by	MicroNXT Solutions Pvt. Ltd.
Platform	ERPNext (open-source)
Document Type	Business Requirement Document (BRD) — Technical
Version	2.2
Basis	BRD v2.1 + client detailing inputs (dealer bands, vehicle tracking, batch suggestion, labour, client dependencies)
Status	For Development & Validation

Confidential — prepared for internal development, review and validation

Document Control

This is the technical Business Requirement Document (BRD) for Pacific Inc's Business Automation & Dealer Distribution System, to be implemented by MicroNXT on ERPNext. It is written as a development and implementation guide: it describes the solution architecture, the functional modules in operational detail, the data structures of the custom (non-ERPNext) document types, the customisations required over ERPNext defaults, the integrations, the automation logic, and the phased delivery plan.

How to read this document

Blue-bordered boxes are business rules or formulas. Purple-bordered boxes marked “Development note” flag where custom ERPNext development is required (a default ERPNext feature does not cover the need).

Commercial figures are excluded; milestone scopes, the two-wave approach and the indicative timeline are included.

Values left open in discussions (thresholds, bands, MOQ, reminder intervals) are configurable and listed in Part G.

Version History

Version	Prepared By	Description
1.0	MicroNXT	Initial requirement document.
2.0	MicroNXT	Technical BRD — architecture, module map, custom data structures, updated workflows.
2.1	MicroNXT	Detailing revision. Adds WhatsApp inquiry flows, detailed transporter/vehicle master, dealer-code identification, barcode/sticker formats, warehouse mobile scanning, dealer-app enquiry, catalog & price-list formats, image bulk-import, detailed bay-allocation, purchase-planning / sample-placement / product-withdrawal automation, migration detail, ERPNext customisation plan and implementation steps. Removes CSP; payment terms use ERPNext default; assisted-calling replaced by WhatsApp reminders.
2.2	MicroNXT	Second detailing revision. Confirmed dealer-classification thresholds; inquiry pricing by dealer type + purchase history; WhatsApp batch-combination suggestion; live vehicle tracking with stop/dwell capture and expanded transport

Version	Prepared By	Description
		master; loose/unallocated stock tracking; reorder review notification; labour attendance & payment doctype; consolidated client-dependency list.

Change Log — What Changed in v2.1

Area	Change in v2.1
Transporter & Vehicle master	Detailed with the actual Morbi→Bengaluru full-load fleet (7 truck tonnages, 4 container tonnages by rail/ship).
WhatsApp inquiry	Sample conversation flows added, aligned to current dealer style; code identification by dealer code and company code; reminders via WhatsApp with response buttons.
Assisted calling	Removed. Follow-up is WhatsApp reminders with response buttons only (dealer follow-up and staff CRM follow-up).
Dealer codes & visibility	Dealer sees only items for which a sample has been issued; can search by own code or product code; dealer↔company code mapping detailed.
Reorder planning	Screen is a review-only window; quantities are auto-generated from historical sales.
Series	Now carries bulk-quantity and retail-quantity thresholds.
Supplier master	GPS coordinates captured on supplier.
Weight / UOM	Weight UOM conversion made explicit; weight shown on all documents.
Barcode / stickers	Barcode/QR printing and sticker formats (box sticker, dealer sample sticker) detailed.
Warehouse scanning	Mobile web scanning interface for inward, pick list, validation and dispatch.
CSP	Removed entirely.
Sample display reconciliation	Added as a dedicated doctype.
Payment policy	Uses the ERPNext default Payment Terms doctype (custom policy doctype removed).
Catalog & price-list formats	Dealer-wise catalog with product/application/multiple images; price-list formats shared with dealer.
Data migration	Expanded: current + last year, key steps, and customized Tally fields.
Image import	Bulk import from Google Drive with filename-to-item-code matching.
Dealer app	Enquiry module detailed.
Automation	Detailed automation for purchase planning, sample placement and product withdrawal; detailed bay-allocation logic.
Implementation	Added ERPNext customisation plan and step-by-step implementation.

Change Log — What Changed in v2.2

Area	Change in v2.2
Inquiry pricing	Price quoted during inquiry is derived from dealer type and the dealer's purchase history to date.
Dealer classification thresholds	Confirmed sales-based bands: below ₹1 lakh → Standard Dealer; ₹1 lakh and above → Dealer; ₹15 lakh and above → Master Dealer (configurable).
WhatsApp batch suggestion	Inquiry replies suggest the batch that meets the required quantity, or a 2–3 batch combination when no single batch suffices.
Vehicle tracking	Live truck location, pickup capture per stop and stop/dwell-time capture; transport master expanded with owner and vehicle number; route/stops shared with driver by link or app.
Loose / unallocated stock	A flow to scan and track stock kept in empty, non-allocated space and route it to a proper bay.
Reorder review notification	Responsible members are notified to review the auto-generated draft reorder plan.
Labour attendance & pay	New doctype to track labourer attendance and payment.
Sales Person Tagging	Tag Sales Person to dealers that are assigned to them
Bay sizes & warehouse design	Accurate bay size/type list and warehouse layout/capacity to be provided by Pacific Team.
Client dependencies	Consolidated list of information required from the client (GST/tax structure, current series numbering & print formats, user list/roles/access, warehouse design).

Table of Contents

Part A — Business Context & Objectives

A.1 Background

Pacific Inc is a B2B tiles distributor selling primarily to dealers from a single Bangalore warehouse. Current operations depend on Tally, phone calls, WhatsApp, manual follow-ups, vendor coordination and Excel-based inquiry tracking, with heavy reliance on individual staff for stock visibility, purchase follow-up, warehouse placement, sample movement, damage handling and reporting.

The objective is a structured, workflow-driven operating system — not merely a replacement accounting package. A recurring principle is that the system must be action-oriented: it should identify exceptions, maintain traceability and prompt users to act, rather than only recording transactions and producing passive reports.

A.2 Business Objectives

- Capture every dealer inquiry in a structured way and drive it to a defined closure (order, PO linkage or reasoned drop).
- Provide real-time, batch-aware, weight-aware stock visibility across the internal system, the web dealer app and WhatsApp.
- Standardise product master creation through a Series-driven model that pre-sets attributes, pricing and bulk/retail thresholds.
- Auto-generate purchase reorder plans from historical retail sales, presenting a review-only screen to the purchase team.
- Plan supplier pickups and optimize vehicle (container vs truck) and route selection for the Morbi→Bengaluru corridor.
- Manage warehouse bay allocation, QR/barcode-based movement and batch traceability, with a mobile scanning interface.
- Enforce pricing, credit and discount controls through submit-freeze approvals with mobile approval and notifications.
- Track damage, insurance claims, settlement and write-off with correct accounting linkage.
- Automate unloading/labour payment tracking and vouchers.
- Automate sample and display lifecycle — placement, monitoring, reconciliation and product withdrawal.
- Deliver a web dealer app and WhatsApp channel with dealer-wise catalog (sample-issued items only) and images.
- Deliver action-oriented dashboards and, in Wave 2, assisted AI (image search, recommendation, forecasting).

A.3 Users & Roles

Approximately ten internal users are considered for initial sizing (no hard cap); around 150 dealers interact through the app and WhatsApp. Menus and permissions are role-based.

Role	Primary Functions
Sales / CRM	Inquiry capture, quotation, dealer follow-up (WhatsApp), order confirmation.
Warehouse	Purchase receipt, bay allocation, QR/scan, picking, dispatch, stock movement, sample placement.
Purchase	Reorder review, vendor enquiry, purchase orders, pickup/route planning, supplier follow-up.
Finance	Outstanding, advance/payment control, unloading payments, claims and write-offs, e-Way bills.
Management (Owner / Delegate)	Approvals, overrides, dashboards. Owner (Mr. Prashanth) is notified of critical actions; a delegate (e.g. Mr. Dhananjay) holds override authority under audit.

Part B — Solution Architecture & Module Map

The solution is layered into a channel layer (how dealers and staff interact), a middleware / API gateway (which protects the core and enforces dealer-wise visibility), the core Frappe/ERPNext backend with custom modules, and an integration layer. This map is the reference for Part C (modules), Part D (data structures) and Part F.4 (customisation plan).

Figure 1 — Solution architecture and module map

B.1 Channel Layer

Channel	Description
WhatsApp Interface	Dealer-facing conversational channel using controlled menus and structured input (item-code / dealer-code search, image confirmation) aligned to how dealers already message today. Supports stock inquiry, order/delivery/payment status, out-of-stock capture and follow-up reminders with response buttons. Phase 1.
Web-Based Dealer App	Browser-based self-service portal (desktop and mobile) for catalog (sample-issued items only), real-time stock, inquiries and orders, status, dues and history. Phase 1. Native iOS/Android and offline apps excluded.
Internal ERP UI	Desktop and mobile browser access for staff.
Warehouse Mobile Scanning	A mobile web interface (and PDA) for the warehouse team to scan and validate at inward, bay placement, picking (pick list) and dispatch.

B.2 Middleware / API Gateway

Dealer-facing traffic (WhatsApp and the dealer app) passes through a middleware layer rather than exposing the core ERP directly. The middleware restricts access, protects the core, enforces dealer-wise catalog / pricing / eligibility consistently across both dealer channels, improves performance and exposes only the required APIs.

Development note — customisation required

The middleware layer, the WhatsApp conversational flow engine and the dealer app portal are custom builds on top of ERPNext's REST/portal framework — they are not ERPNext default features.

B.3 Core Backend Modules

Module	Responsibility
Master Data	Series, Item, Dealer/Customer, Supplier (with GPS), Transporter & Vehicle, Warehouse & Bay, price lists, UOM/weight.
Dealer Inquiry & CRM	Structured inquiry, code identification, duplicate detection, missed demand, WhatsApp follow-up, closure via PO linkage.
Sales & Order Management	Quotation with price working, Sales Order from customer PO, reservation, delivery dates, drop-ship, delivery note, invoice, e-Way bill.
Purchase & Reorder Planning	Auto-generated reorder plan (review-only), MOQ handling, vendor enquiry, POs, receipt and shortage handling.
Supplier Pickup & Route Planning	Supplier GPS, pickup plans, container/truck capacity, route optimisation, driver route sharing.
Inventory: Batch, Bay, QR / Scan	Batch and variable weight, bay master and allocation logic, QR/barcode generation and sticker printing, mobile scanning validation, stock movement.
Pricing Engine	Series price setting, three price lists, retail markup, quotation price working, price-list formats for dealers.
Damage & Insurance Claims	Damage identification, claim accumulation and voucher, settlement modes, write-off and accounting linkage.
Unloading Payments	LR-wise unloading/labour charges, payment modes and vouchers.
Sample & Display Management	Sample approval, dealer-specific QR, placement automation, reconciliation, product withdrawal, pullback.
Approvals & Workflow	Submit-freeze, override triggers, amend/cancel with version diff, mobile approvals.
Reporting, Dashboards & AI	Action-oriented dashboards and reports; Wave 2 assisted AI (image search, recommendation, forecasting).

B.4 Integration Layer

Integration	Purpose
WhatsApp / Meta	Dealer messaging; subject to Meta approvals and template approval.
India Banking (VALS API)	Real-time reflection of bank transactions for advance-payment and dispatch control; integrated with ERPNext.

Integration	Purpose
GST & e-Way Bill API	GST invoicing and automatic e-Way bill generation.
Maps / Routing API	Supplier GPS, distance/time computation and route optimisation.
OCR / AI	Reading customer POs (email / WhatsApp / physical) with confirm-on-mismatch; supplier documents subject to feasibility.
Google Drive	Bulk product-image import with filename-to-item-code matching.
AI Image Search & Recommendation	Wave 2 assisted image search and recommendation.

B.5 ERPNext vs Custom — Development Overview

The build reuses ERPNext where it fits and adds custom components where the business need is not met by defaults. Part F.4 gives the full customisation plan; the summary is:

Delivered by ERPNext default (with configuration)	Custom development required
Customer, Supplier, Item, Warehouse, Batch, UOM, Price List.	Series doctype and series-to-item auto-population.
Quotation, Sales Order, Purchase Order, Purchase Receipt, Delivery Note, Sales Invoice, Payment Entry, Stock Entry.	Dealer Inquiry / CRM doctype, duplicate detection and missed-demand aggregation.
Payment Terms (for dealer payment policy).	Auto-generating Reorder Plan (scheduled job + review screen).
Roles & permissions, workflow engine, print formats, report builder, dashboards.	Transporter & Vehicle master; Pickup/Route Plan and route optimisation.
Portal framework (basis for dealer app).	Warehouse Bay master and bay-allocation logic; Bay Allocation Slip.
REST API (basis for middleware / integrations).	QR/sticker print formats and mobile scanning validation UI.
Batch and stock ledger.	Claim Voucher; Unloading Payment Voucher.
e-Way bill (via GST integration).	Sample Request, Display Placement Slip, Sample Display Reconciliation and product-withdrawal batch job.
Notifications framework (email).	WhatsApp flow engine + reminder/response-button handling; dealer app; India Banking, OCR and Google Drive integrations.

Part C — Functional Requirements by Module

C.1 Master Data Module

C.1.1 Series-Driven Item Model

The Series is the core master concept. A Series is a manufacturer/company collection sharing a common size, thickness, finish and price point. It carries an attribute section, a price section and — new in this version — bulk-quantity and retail-quantity thresholds. When an item is created and a series is selected, the item inherits the series attributes, pricing and bulk/retail thresholds automatically; only a small set of values vary at item level. One series yields 20–25 items.

Figure 2 — Series-to-item data model

Key series rules

A change in size or thickness creates a NEW series — a series never holds multiple sizes or thicknesses.

Colour is variable and set at item level, not on the series.

Finish is a two-level dropdown: a prime finish (Matt / Glossy) with sub-finishes (rocker, carving, stone-art, GVT/PGVT, etc.).

All three price lists, and the bulk and retail quantity thresholds, are set on the series and flow to every item under it.

Development note — customisation required

Series is a custom doctype. Item creation must be driven by a client script / server hook that copies the selected series' attributes, price-list rates and bulk/retail thresholds onto the new Item and its child tables. This series-to-item propagation is custom (ERPNext has no Series concept).

C.1.2 Item Attribute Dictionary

Item attributes are controlled dropdowns constituting the item:

Attribute	Attribute	Attribute
Size	Finish	Colour
Base Colour	Thickness	Series
UOM	Pieces per Sq Ft	Weight per Box
Batch	Lead Time	Status

Colour is captured as both Colour and Base Colour. Lead time exists at item level but is dynamic and often cannot be pre-defined for manufactured tiles; procurement lead-time configuration is not part of initial scope (Part G).

C.1.3 UOM & Weight Handling

Box is the primary purchase and stock UOM. Pieces, Square Feet and Square Metre are conversions from Box. Weight handling is a key requirement:

- Every UOM carries a conversion factor; the system must convert freely between box, pieces, square feet, square metre and weight.
- A standard weight is held at series/item level (per tile and per box); the actual, variable batch weight is captured at inward and overrides the standard for that batch.
- Weight (in the correct UOM) must be displayed on every relevant document — inquiry, quotation, sales order, delivery note, invoice, purchase order, receipt, pickup plan, bay allocation slip and stickers.

Development note — customisation required

ERPNext supports UOM conversion on Item, but per-batch variable weight and the requirement to surface weight on all transaction print formats need custom fields (batch weight) and custom print-format logic. Add a batch-level weight field and a computed “total weight” on transaction lines and totals.

C.1.4 Dealer / Customer Master

Dealers are classified on two independent axes; payment terms use the ERPNext default Payment Terms mechanism.

Classification	Values / Basis
Price classification	Standard Dealer / Dealer / Master Dealer, based on the dealer's sales. Confirmed initial bands (configurable): below ₹1 lakh → Standard Dealer; ₹1 lakh and above → Dealer; ₹15 lakh and above → Master Dealer. Out-of-Bangalore dealers may receive Master Dealer pricing (MDP) to absorb higher transport cost.
Dealer type	Retail / Bulk / Project / Distributor. Drives default retail-vs-bulk treatment: a bulk/project dealer defaults to bulk quantity even for a small order; a retail dealer defaults to retail.
Payment policy	Configured using ERPNext's default Payment Terms / Payment Terms Template (credit vs advance). Special items may require 100% advance (see C.3.4).

Each dealer also carries their catalog visibility (see C.1.5) and, later, an assigned salesperson. Dealer eligibility criteria and demotion are configurable business rules to be defined.

Dealer classification bands (sales-based, configurable)

Below ₹1 lakh → Standard Dealer

₹1 lakh and above → Dealer

₹15 lakh and above → Master Dealer

The measurement basis (period / rolling window) is configurable; these thresholds are the confirmed starting values.

C.1.5 Dealer Codes & Sample-Based Catalog Visibility

Dealers use their own product codes as well as Pacific Inc's company (product) codes. Both are stored so a dealer can be recognised by either. This is central to inquiry, the dealer app and WhatsApp:

- Each dealer's product codes are stored against the corresponding company item code in a dealer-code mapping (Item child table 'Customer Part Number' — see Part D).
- A dealer can search and inquire using their own code OR the company product code; the system reverse-maps to the internal item.
- A dealer can only access items for which a sample has already been issued to that dealer. Catalog visibility is therefore driven by the dealer's issued-sample list, not the full inventory.
- For key dealers, code mappings are bulk-imported via templates (see F.3).

Development note — customisation required

Dealer-code identification (match on either dealer code or company code), sample-issued catalog gating, and reverse-mapping in inquiry/app/WhatsApp are custom. Implement a resolver service the middleware and WhatsApp/app call to turn any incoming code (or image) into an internal Item, scoped to the dealer's issued samples.

C.1.6 Supplier Master

Suppliers (manufacturers/factories, mostly in Morbi, Gujarat) capture standard details plus GPS coordinates and factory location, used for pickup and route planning (C.5). The insurance-holder reference is captured for claims (C.8). A supplier may also be flagged as a transporter where applicable.

Field	Purpose
GPS coordinates (latitude, longitude)	Route optimisation and pickup sequencing.
Factory location / address	Pickup stop identification.
Insurance holder / policy reference	Claims routed via the supplier's insurer (C.8).
Material-ready contact	Vendor enquiry and follow-up.

Development note — customisation required

Add custom fields for GPS coordinates (and optionally a

Field	Purpose
geolocation field) on Supplier; these feed the Maps/Routing integration.	

C.1.7 Transporter & Vehicle Master

Transporters and their vehicles are mastered for pickup and route planning on the Morbi (Gujarat) → Bengaluru corridor for full loads. Vehicle type determines capacity and mode. The confirmed fleet is:

Mode	Vehicle Type (full load)	Capacity
Truck (by road)	Truck	43.50 Tonnes
Truck (by road)	Truck	42.00 Tonnes
Truck (by road)	Truck	41.00 Tonnes
Truck (by road)	Truck	40.50 Tonnes
Truck (by road)	Truck	35.00 Tonnes
Truck (by road)	Truck	31.00 Tonnes
Truck (by road)	Truck	25.00 Tonnes
Container (rail + road)	Container	32.50 Tonnes
Container (rail + road)	Container	31.00 Tonnes
Container (ship + road)	Container	28.00 Tonnes
Container (ship + road)	Container	31.00 Tonnes

Each vehicle type records its mode (road / rail+road / ship+road), full-load capacity in tonnes, indicative transit time and standard rate basis. Rates are largely standard across transporters for a given vehicle type. The capacity values drive utilisation and overload checks in pickup planning (C.5).

The transport master records, per vehicle, the owner, vehicle number, vehicle type and capacity, alongside mode and indicative transit time. When a pickup is planned, the driver is notified of the route and the sequenced stops (pickup points) and can view them through a shared link or the app (see C.5.1).

Development note — customisation required

Transporter is a custom master with a Vehicle child table (owner, vehicle_number, vehicle type, mode, capacity_tonnes, transit_days, rate basis). ERPNext's transporter (a Supplier flag) does not model vehicle-type capacity; a custom master is required.

C.1.8 Warehouse & Bay Master

Initial scope is a single Bangalore warehouse; which consists of different bays. Each bay records code, type, size, capacity, suitable category, current occupancy, available space, status and (for buffers) the linked main bay. Bay types: Main, Buffer, Damage, Insurance Claim, Display/Sample and

Blocked/Reserved. Bay sizes (e.g. 36×6, 36×8, 32×6, 32×8 ft) are warehouse bay areas, not tile dimensions.

Client dependency

The full list of bay sizes and bay types, and the warehouse design / layout and capacity, are to be provided by Pacific Inc and configured during setup (see F.9).

C.2 Dealer Inquiry & CRM Module

C.2.1 Inquiry Capture & Code Identification

Inquiries are captured in a structured workflow from WhatsApp, the dealer app, phone or internal entry. Item identification accepts the dealer's own code, the company product code, or a product image, and resolves to the internal item — scoped to items for which the dealer has been issued a sample. A closest-match search (target ~85–90% confidence) is applied; on a mismatch or multiple candidates, the user/dealer is prompted to confirm the exact code rather than the system guessing (this prevents the variant-confusion errors seen in the past, e.g. one finish or sub-type mistaken for another).

Price quoted during an inquiry is not a flat list price: it is derived from the dealer's classification (Standard / Dealer / Master Dealer) together with the dealer's purchase history to date, so a dealer sees the price appropriate to their brand and relationship. The applicable price list is selected from the dealer classification and adjusted per the dealer's history, and any change beyond the derived price is an override requiring approval (C.11).

C.2.2 WhatsApp Inquiry Flow

The WhatsApp flow is kept simple and aligned to how dealers already message today (per style, with quantity in boxes/pieces, often quoting a code or sending an image). The logic is below, followed by representative sample conversations.

Figure 3 — WhatsApp dealer inquiry logic

Batch suggestion in the inquiry reply

When the item is available, the reply suggests the batch that can meet the required quantity.

If no single batch holds enough, the system suggests a 2–3 batch combination that together fulfils the requirement.

Sample conversation — item in stock:

Dealer message	System reply (WhatsApp)
“White tiles 40 boxes available?” (or sends code / image)	Identifies item from dealer/company code or image (within issued samples). Replies with product image, name, size, finish, the suggested batch (or a 2–3 batch combination that meets the quantity), and price. Buttons: [Enquire more] [Place order].
Taps [Place order]	“Please share your PO number to confirm.” Dealer enters own PO number → Sales Order created; confirmation sent.

Sample conversation — item out of stock:

Dealer message	System reply (WhatsApp)
“Moon Onyx 150 boxes?”	Identifies item; stock insufficient. Captures the inquiry and missed demand, triggers reorder/vendor enquiry, and replies with expected lead time and a suggested alternative. Buttons: [Notify when available] [See alternative] [Close].

Dealer message	System reply (WhatsApp)
No response after follow-up window	Reminder message with buttons: [Still need] [Received elsewhere] [Cancel]. Outcome recorded against the inquiry.
Development note — customisation required The WhatsApp conversational flow (menu logic, code/image resolution, template messages, buttons and reminder handling) is a custom middleware + flow-engine build against the WhatsApp/Meta API; it is not an ERPNext feature. Templates require Meta approval.	

C.2.3 Inquiry Status & Closure

Each inquiry carries a lifecycle status (Open, Available, Partially available, Out of stock, Pre-order required, Quoted, Converted to order, Mapped to PO, Rejected, Closed). Closure is driven by the customer PO: an inquiry is closed only after a customer PO number is linked to it, and ultimate closure is on the connected sales invoice. Dropped inquiries record a reason, producing a clean missed-opportunity / conversion record.

C.2.4 Duplicate Inquiry & Duplicate PO Detection

The system detects repeat inquiries for the same dealer, item and quantity within a configurable window (48 hours as a starting default) and prompts to confirm whether the inquiry continues an earlier one. It similarly flags duplicate customer POs (same dealer, same quantity and material, different PO number) so the same order is not reserved or procured twice.

C.2.5 Missed Demand

Genuine repeated inquiries where stock is unavailable — for example several inquiries for the same design from different dealers, with quantity variation above a configurable threshold — contribute to missed-demand analysis and surface on the reorder plan as a suggestion.

C.2.6 Follow-up via WhatsApp (No Calling)

Follow-up is WhatsApp-only

There are no calling notifications and no automated voice calls.

Dealer follow-up: unresolved inquiries send WhatsApp reminders with response buttons (e.g. [Still need] [Received elsewhere] [Cancel]); the dealer's tap is recorded and updates the inquiry.

Staff CRM follow-up: WhatsApp reminders are also triggered to staff for pending CRM actions, with response buttons to update status.

Reminder cadence is configurable (e.g. up to three within a week).

C.3 Sales & Order Management Module

C.3.1 Order Lifecycle & Reservation

A customer PO becomes an internal Sales Order. If stock is available it converts to delivery and invoice; if not, it drives a purchase order, inward and bay placement before delivery. Delivery date is mandatory on the Sales Order and can be maintained item-wise for multi-item orders. Stock is reserved on confirmation, but long-duration commitments are reviewed and can be released so material is not blocked idle — the system distinguishes a customer's delivery commitment from actual physical stock availability. Weight (UOM-converted) is shown on every sales document.

Figure 4 — Order-to-cash lifecycle with reservation

C.3.2 Supplier vs Customer Timelines

Two timelines are maintained separately: the supplier/factory commitment date and the customer's committed delivery date. Supplier delays are compared against the customer commitment; only where a delay threatens the customer date does the system flag the impact and trigger escalation and dealer notification. A forecasting/stock window shows, per order and item, stock-in-hand, in-transit and factory-dispatch status, groupable by customer, item or supplier.

C.3.3 Bill-to / Ship-to, Drop-ship & e-Way Bill

Bill-to and ship-to are mandatory and validated, particularly for interstate and site deliveries. Drop-ship is supported: a Sales Order links to a purchase order carrying the customer's bill-to/ship-to, the supplier ships directly to the customer/site, and the invoice carries the correct addresses. The system reads pin codes, computes distance and automatically generates e-Way bills for interstate and threshold-crossing consignments.

Figure 5 — Drop-ship and bill-to / ship-to flow

C.3.4 Advance Payment & Dispatch Control

Payment terms are configured with ERPNext Payment Terms at dealer level. Cash/advance dealers typically pay an advance against order and 100% before dispatch; special items may require 100% advance. Where an advance condition applies, dispatch/loading is blocked until the payment condition is satisfied — the receipt, reflected via the India Banking / VALS API, acts as the release trigger, so goods do not load until the system shows the required payment.

Development note — customisation required

The dispatch-lock (block Delivery Note / gate-out until the required advance is confirmed via VALS API) and the supplier-delay impact check are custom automations layered on ERPNext's Payment Terms and Sales Order.

C.4 Purchase & Reorder Planning Module

C.4.1 Reorder Planning — Auto-Generated, Review-Only

The reorder screen is a review window, not a data-entry screen

Suggested purchase quantities are generated automatically by the system from historical retail sales and stock position; the purchase team does not type them in.

The team reviews the auto-generated plan and adjusts quantity or frequency only where needed before creating POs.

A scheduled job computes the plan from retail sales over the last 3–6 months (excluding bulk/project sales), current stock, reserved quantity, in-transit quantity, pending quantity and missed demand. The suggested quantity targets a configurable stock level ($\approx$ three months mandatory, orders typically for two months), is rounded up to the nearest 5 boxes and checked against the applicable MOQ.

Figure 6 — Purchase-planning automation (auto-generate → review)

Reorder formula (configurable)

Net available = Current stock – Reserved + In-transit

Suggested reorder = Target stock ($\approx$ N months of avg retail sales) – Net available + Pending/missed demand

Round UP to nearest 5 boxes; then apply MOQ (company / vendor / production).

The review screen shows, per item: average sales, current stock, reserved, in-transit, available, pending, missed demand, MOQ, suggested reorder quantity, item-level reorder frequency, supplier/item-group filter, active/discontinued status, last purchase date and lead time.

When the scheduled job generates a draft reorder plan, the responsible members (purchase team / reorder owner) are notified to review it, so an auto-generated draft is always actioned rather than left unseen.

Development note — customisation required

The reorder auto-calculation (scheduled job), the Reorder Plan doctype and its review screen are custom. ERPNext's native reorder level is too simple for this multi-factor, retail-only, round-up, MOQ-aware logic.

C.4.2 MOQ Hierarchy & Vendor Enquiry

MOQ may apply at company, vendor/manufacturer and item level, and production MOQ may differ from stock MOQ. When a requirement is below MOQ, the system prompts to raise to the applicable MOQ. A vendor enquiry determines whether material is available from ready stock or must be produced, capturing expected readiness and available quantity. The indicative 80-box company MOQ is not treated as universal until confirmed per item/category.

C.4.3 Retail vs Bulk Classification

Every invoice is tagged retail or bulk. Classification is rule-based at series and size level: each series carries a bulk-quantity and a retail-quantity threshold (see C.1.1 / Part D), and dealer type also drives the default (bulk/project dealer → bulk). Only retail sales drive reorder suggestions; bulk/project sales are excluded from reorder and from top-dealer/sample logic. Auto-classification applies, with an audit-locked manual override for exceptions.

C.4.4 Purchase Receipt & Shortage Handling

Purchase receipt captures supplier, PO, item, quantity received, batch (with variable weight), shortage and damaged quantity, bay allocation, QR generation, LR number and supplier invoice reference. On a shortage, responsibility is recorded (factory in most cases, sometimes the driver, otherwise absorbed), a claim or credit/debit note is initiated, and the shortage is linked to the PO and LR.

C.5 Supplier Pickup & Route Planning Module

Supplier GPS coordinates (C.1.6) are used to plan pickups on the Morbi→Bengaluru corridor. The system selects between container and truck (C.1.7 fleet) and optimises the route. Container is cheaper but slower (rail/ship + road, ~15–20 days, up to ~3 factories per trip); truck is faster (~5–6 days, up to ~9–10 factories) but more expensive. Planned orders (new launches, reorders, large projects) prefer container; urgent/on-demand orders use truck. For price-list purposes the maximum (truck) pricing is used as the base.

Figure 7 — Route and vehicle (container/truck) planning

Route optimisation rule

The system provides BOTH time-optimised and distance-optimised routing, and presents both so the planner can choose.

Real-time traffic and toll preference are not decision factors at this stage.

Capacity planning uses the fleet tonnages (C.1.7) with utilisation and overload warnings; up to ~30–40 GPS stops can be sequenced. Plans are shareable with drivers.

Development note — customisation required

Pickup/Route Plan doctype, the container-vs-truck selection logic, capacity/overload checks and the Maps/Routing API integration (time and distance options) are custom.

C.5.1 Vehicle Tracking & Stop Capture

Once a pickup plan is dispatched, the system tracks which truck is where and what it has picked. Live GPS gives the truck's current location; at each supplier stop the system captures arrival time, the items picked (quantity and weight), the dwell time (how long the truck stayed at that supplier) and the departure time. A consolidated view shows, for each truck, its current location, what has been picked so far and the remaining stops. The driver receives the route and sequenced pickup points on assignment and can view them through a shared link or the app.

Figure 7b — Vehicle tracking and stop/dwell capture

Development note — customisation required

Live vehicle tracking, per-stop pickup capture and stop/dwell-time capture are custom, built on the Maps/Routing integration and the Pickup/Route Plan; a tracking log holds location pings and stop events. Confirm the GPS source (driver-app location vs a vehicle GPS device) during setup.

C.6 Inventory: Batch, Bay, QR & Scanning Module**C.6.1 Batch Tracking & Variable Weight**

Weight is maintained at batch level and is variable — a standard weight is held on the series/item, and the actual batch weight (which changes when the manufacturer changes materials) is entered when inventory is received. Batches are created at inward, not at PO stage, and the batch value includes the manufacturer's date of manufacturing (the company uses DoM as its batch). For a repeat PO, the system can reference the last received batch's weight. Weight is carried through and displayed on all downstream documents.

C.6.2 Batch Visibility & Top-3 Batches

Stock is traceable at batch level. For practical dealer-facing visibility, the system consolidates and shows the top-3 batches by available quantity, with drill-down to full batch detail on request. The exact dealer-facing batch-sharing rule is configurable (some dealers demand single-batch supply, which the business wants to control rather than expose by default).

C.6.3 Bay Allocation Logic

Bay allocation is system-suggested and warehouse-confirmed. The detailed logic is shown below: incoming material is first checked for damage/claim routing; otherwise the system determines the suitable bay type for the item's category, checks main-bay space and capacity, falls back to a linked buffer

bay (or a main+buffer split) on overflow, consolidates open/partial quantities and avoids style/batch mixing, then produces a bay allocation slip for confirmation before unloading; occupancy is recomputed after the QR scan update.

Figure 8 — Bay allocation logic

Development note — customisation required

Warehouse Bay master, the bay-suggestion algorithm (category, batch, size, occupancy, buffer linkage, open-box consolidation) and the Bay Allocation Slip doctype are custom.

C.6.4 QR / Barcode Generation, Stickers & Printing

Two sticker types are generated. The box / inward sticker is printed per box at purchase receipt (printing handled by the purchase team) and encodes the company item code, product name, size/finish/series, batch (including manufacturing date), bay, boxes/pieces, weight, and PR and supplier references. The dealer sample sticker (see C.10) carries a dealer-specific unique code, the human-readable product name, series/size/finish and the sample batch. Both are QR-based; barcode fallback is supported. The sticker field layouts are below.

DEALER SAMPLE STICKER	
Dealer-specific unique code	[QR CODE]
Product name (human-readable)	
Series • Size • Finish	
Sample batch (traceability)	

PACIFIC INC — BOX / INWARD STICKER	
Item code (company) + Product name	[QR CODE]
Size • Finish • Series	
Batch no. (incl. mfg date)	
Bay • Boxes / Pieces • Weight (kg)	
PR ref • Supplier ref	

Figure 9 — Box/inward sticker and dealer sample sticker formats

Development note — customisation required

Sticker layouts are custom Print Formats; QR generation and the per-box print run (batch printing from a purchase receipt) are custom. Confirm label size and printer/scanner hardware during setup.

C.6.5 Warehouse Mobile Scanning Interface

The warehouse team uses a mobile web interface (and PDA) to scan and validate throughout. The user selects a task — inward, bay placement, pick (against a pick list) or dispatch — scans the QR/barcode, and the system validates item, batch, bay, quantity and pick list. A match confirms and updates stock/bay/pick; a mismatch alerts and blocks the action. When a pick list is complete, dispatch validation gates the material out.

Figure 10 — Warehouse mobile scanning, pick list and dispatch

Development note — customisation required

The mobile scanning UI (task selection, scan-validate-confirm, pick-list execution and dispatch gate) is a custom mobile web interface calling ERPNext stock APIs; it is not the ERPNext default desk UI.

C.6.6 Loose / Unallocated Stock Tracking

Sometimes a single tile or box is set down in an empty space that is not an allocated bay. This must still be tracked so stock does not go invisible. Using the mobile scanning interface, the item and the ad-hoc location are scanned and recorded as loose / unallocated stock (item, batch, quantity, location); it then appears on an unallocated-stock check/report, from which the warehouse either allocates it to a proper bay (bay allocation slip) or consolidates it with existing open/partial stock. A periodic check helps ensure nothing remains untracked in unallocated space.

Figure 10b — Loose / unallocated stock tracking

Development note — customisation required

Loose/unallocated stock capture (scan item + ad-hoc location), the unallocated-stock report and the allocate/merge flow are custom, layered on the scanning UI and Bay master.

C.7 Pricing Engine Module

C.7.1 Series Price Setting

Pricing is a first-time activity performed at series level. The landing cost is built from factory-side components (basic rate per box, insurance %, freight, loading) and the margin is applied to derive the three price lists (Standard Dealer, Dealer, Master Dealer) and MRP. Insurance % is configurable and standardised per series. Margin varies by series (premium series carry higher margin). The build-up is retained as a price working for reference and audit.

At the point of quoting (inquiry or quotation), the price list applied is selected from the dealer's classification (Standard / Dealer / Master Dealer per the sales-based bands in C.1.4) and adjusted for the dealer's purchase history to date, rather than a single flat list price.

Pricing formula (configurable)

Landing Cost = Basic Rate + Freight + Loading + Insurance + Other landed costs

Suggested Dealer Price = Landing Cost + Margin %

Three price lists derive from the series margin structure; for price-list purposes the maximum (truck) freight is used.

C.7.2 Quotation Price Working & Retail Markup

Quotations use a separate per-item price working, so a project or negotiated quotation can rework freight (container vs truck), margin and discount without disturbing the master price list. The working shows a clear bifurcation (with/without GST, with/without transport) and supports a transport dropdown by factory-to-location. Retail customer quotations may apply a markup percentage over the approved dealer price as a quotation-level override only.

C.7.3 Discounts

Discount is not assumed automatically from dealer identity; the default is the dealer's applicable price list. Any transaction-level price or discount change — even a one-rupee change — is an override requiring approval and notification (C.11).

Development note — customisation required

The series price-setting calculator and the quotation-level price working (with cost build-up and GST/transport bifurcation) are custom. ERPNext Price Lists hold the resulting rates, but the calculation UI and the per-quotation rework are custom.

C.8 Damage & Insurance Claims Module

Damage may occur in transit, at unloading, during inspection or during warehouse movement. Damaged goods move to a damage bay and, where applicable, to an insurance claim bay. Because individual

damage values are small (a commonly accepted quantum per truckload), small values are accumulated — always grouped by supplier/company — before a claim voucher is raised.

Figure 11 — Damage and insurance claim flow

C.8.1 Claim Voucher & Settlement

A claim voucher records claimed, approved and received amounts and net loss, with linked supplier/consignment/invoice references and supporting documents. Settlement is by one of: insurance (the vendor holds the policy and passes settlement via a credit note to Pacific Inc), vendor credit note, partial settlement, or non-settlement / write-off. Escalation reports track pending insurance follow-up.

C.8.2 Accounting Treatment & Write-off

A claim voucher is not accepted for tax purposes, so it is held operationally and reconciled: removed by a journal at year-end (31 March) and reinstated on 1 April, and cancelled when the corresponding credit note is received. Material determined unusable is written off from stock (rather than remaining in damages) and handled via salvage or disposal. Transit damage from warehouse to customer is Pacific Inc's responsibility and handled by credit note. The operational claim record and its accounting treatment stay linked throughout.

C.8.3 Shortage Claims

Shortages identified at receipt (C.4.4) feed the same claim/credit-note mechanism, with recorded responsibility (factory / driver / absorbed).

Development note — customisation required

Claim Voucher doctype, supplier-wise accumulation, the settlement-mode handling and the year-end journal reconciliation cycle are custom on top of ERPNext's credit/debit note and stock write-off.

C.9 Unloading & Labour Payments Module

C.9.1 Unloading Payments

Unloading and labour charges are captured against the consignment/LR: labour/vendor, amount payable, payment mode (PhonePe, Google Pay, UPI, NEFT, bank transfer, cash), paid/unpaid status, transaction reference, linked purchase receipt and supporting attachment. Payment vouchers are generated per consignment. Automatic payout is not included unless separately confirmed; the module tracks and records payments.

Development note — customisation required

Unloading Payment Voucher doctype and LR-wise linkage to purchase receipts are custom.

C.9.2 Labour Attendance & Payment

Beyond consignment-linked unloading charges, the system tracks labourers directly: a labour attendance and payment record captures each labourer, days/shifts present, work done (e.g. unloading, movement), the amount due and the amount paid, with payment mode and reference. This gives a running view of labour attendance and dues, and links to the unloading vouchers where the work was consignment-related.

Development note — customisation required

Labour Attendance & Payment is a custom doctype (labourer master reference, attendance entries, computed dues and payments). It is not covered by ERPNext defaults; if formal HR payroll is later required it can move to the ERPNext HR module.

C.10 Sample & Display Management Module

C.10.1 Sample Approval & Dealer-Specific QR

Sample movement requires approval: a sample request is created, approved, and only then moved out (through a proper stock movement or invoice), after which it leaves the pending list. Each sample carries a dealer-specific unique QR (see the sample sticker in Figure 9) — the same product placed with different dealers gets different codes (a per-dealer prefix/suffix over the item code) — while remaining human-readable by product name. Samples retain the batch they were issued from for traceability, but that batch does not force the same batch on a future sale.

C.10.2 Sample Placement Automation & Monitoring

When a sample is issued, a Display Placement Slip is auto-created (capturing item, dealer/location, quantity, placement date and a photo); the placement date starts the monitoring clock. Configurable reminders (e.g. 3 / 6 / 12 months) are sent by WhatsApp and email with response buttons, and periodic reconciliation identifies displays needing review, replacement, return or follow-up.

Figure 12 — Sample placement automation and monitoring

C.10.3 Sample Display Reconciliation

A dedicated Sample Display Reconciliation doctype records the outcome of each monitoring cycle for sample/display stock held at dealer locations. The dealer (or staff) responds via WhatsApp buttons — [Still displayed] / [Removed] / [Loose / not shown] — and the response updates the reconciliation record. This keeps the display stock at dealer locations reconciled rather than assumed, and drives the removal + put-up list (replace a slow-moving displayed design with a newer design not yet displayed).

Development note — customisation required

Sample Request, Display Placement Slip and Sample Display Reconciliation are custom doctypes. The placement-slip auto-creation, the monitoring scheduled job, reminder dispatch and WhatsApp button handling are custom automations.

C.10.4 Top Dealer Logic & Pullback

Top dealers for sample/display planning are identified from retail sales over the last six months, excluding bulk/project sales. On discontinuation or removal, displays are pulled back to the warehouse with returned-condition tracking and a decision to resell, write off or move to clearance.

C.10.5 Product Withdrawal Automation (Discontinued / Pacific-Discontinued)

A daily batch job scans every item and moves it through the lifecycle Active → PDC → Against Order → Discontinued based on configurable, series-level criteria: displayed for at least a configurable number of months in at least a configurable number of stores, AND annual retail sales below the series threshold. PDC (Pacific-discontinued) means the item is not replenished and hidden from dealers; Against Order means it is ordered only on specific demand; Discontinued means the factory has stopped it

permanently. Reaching a withdrawal state auto-triggers the display removal + put-up list, pullback to warehouse and an alternate-product suggestion. The threshold is set at series level while the status change is confirmed at item level.

Figure 13 — Product withdrawal automation

Development note — customisation required

The daily withdrawal batch job (display-duration, store-count and annual-sales checks), the state transitions and the auto-triggered removal/put-up/pullback actions are custom scheduled automations.

C.11 Approvals & Workflow Module

The system uses a submit-freeze model: a document is freely editable in draft and frozen on submission. Certain fields (e.g. delivery date) can be edited by authorised users without cancelling; a full amendment or cancellation produces a version diff and routes for approval. The owner is notified of critical actions (e.g. cancellations, quantity reductions on a PO already sent to a vendor) even when a delegate acts.

Figure 14 — Approval and submit-freeze workflow

Override triggers requiring approval

Credit-limit exceedance and overdue outstanding.

Any pricing override (even a one-rupee change) and any discount over the default price list.

Amendment or cancellation of a submitted sales/purchase document.

Retail-vs-bulk classification override (audit-locked, authorised user only).

Notifications for the above are delivered via WhatsApp, email, in-app and SMS, with mobile approval.

Development note — customisation required

The six override triggers, the amend/cancel version-diff routing and the owner-notification-on-critical-action are custom, built on ERPNext's workflow engine and notifications.

C.12 Reporting, Dashboards & Assisted AI Module

C.12.1 Action-Oriented Dashboards

Dashboards surface exceptions and initiate action. Core linkages: Short Stock → Reorder, Pending Inquiry → Follow-up, Supplier Delay → Impact Check, Sample Ageing → Review/Replacement, Damage → Claim, and Pending Payment → Dispatch Restriction. Role dashboards (CEO, Sales, Purchase, Sample/Display, Finance) roll up into a management view with monthly/yearly performance, top sellers, top designs, top supplier brands, and top/low-performing dealers with corrective prompts.

C.12.2 Report Set

Report	Report
Inquiry register (CRM)	Open / pending inquiry
Duplicate inquiry	Missed demand / opportunity
Inquiry-to-PO mapping	Inquiry conversion
Reorder planning	PO pending
Purchase pickup plan	Bay occupancy
Visual stock balance	Batch-wise & top-3 batch stock
Consolidated stock	Fragmented quantity
Stock movement	Stock ageing
Short / insufficient stock	Retail vs bulk
Damage & transit damage	Claimable value / insurance claim
Unloading payment	Pricing
Fast / slow-moving product	Stock clearance suggestion
Display placement & ageing	Display replacement / put-up
Dealer & salesperson performance	Advance payment / pending-before-loading

C.12.3 Salesperson Assignment

A salesperson-to-dealer assignment is to be introduced, with targets and performance reporting, supporting ownership of dealer relationships and incentives.

C.12.4 Customer PO OCR & Product Matching

Customer POs arriving by email, WhatsApp, physical document or a customer system are read via OCR/AI to extract PO number, items and quantities. The system does not silently accept an uncertain match: at a target confidence (~85–90%) it auto-matches, and on ambiguity or multiple candidate items it prompts the user to confirm the exact item. Supplier email/document reading is a candidate capability subject to feasibility and format validation.

C.12.5 Assisted AI (Wave 2)

Wave 2 adds assisted AI: image-based product search (dealer sends an image; the system matches catalog items and suggests similar/alternative products by colour, finish, pattern, tone, size, design family and available stock), a rule-based-plus-AI recommendation engine for out-of-stock and alternatives, and assisted forecasting on retail sales, inquiries, missed demand, stock ageing and lead time. Accuracy depends on image quality and tagging; an enterprise-grade accuracy guarantee is not in scope.

C.12.6 Future Customer API Integration

For larger dealers running their own ERP, a future API integration would let a dealer's PO transfer into Pacific Inc's system. An interim approach converts a dealer inquiry directly to an order where the dealer enters their own PO number to tag and close it. Feasibility and specifications remain to be evaluated.

C.13 Web Dealer App — Enquiry Module

The web dealer app is a browser-based portal (desktop and mobile) that complements WhatsApp. Its enquiry module is central and behaves consistently with the middleware's dealer-wise rules. The dealer flow is below.

Figure 15 — Dealer app enquiry flow

C.13.1 Enquiry Module Behaviour

- Login is dealer-specific; the dealer sees only items for which a sample has been issued to them.
- The catalog shows each item with its images (product, application/room and additional images — see C.14) and, where enabled, price.
- Search accepts the dealer's own code or the company product code; both resolve to the internal item.
- The item detail shows images, real-time stock, the top-3 batches and price (if enabled for that dealer).
- If in stock, the dealer can convert the enquiry to an order, entering their own PO number to tag and close it.
- If out of stock, the dealer raises an inquiry / out-of-stock request and sees alternative and recommended items.
- The dealer tracks order and delivery status, dues/outstanding, and order/inquiry history, and receives follow-up and status notifications.

Development note — customisation required

The dealer app (portal pages, dealer-scoped catalog, code-resolver search, enquiry-to-order with dealer PO, status/dues/history and notifications) is a custom portal build on ERPNext's website/portal framework, sharing the middleware's dealer-visibility rules with the WhatsApp channel.

C.14 Catalog & Price-List Formats for Dealers

C.14.1 Dealer Catalog Format (with Images)

A dealer-facing catalog is generated per dealer, restricted to the items for which that dealer has been issued samples. Each catalog entry carries the item's images — a primary product image, an application/room image and additional images — with the item's key attributes. The catalog can be produced with or without price (price-inclusive or price-exclusive versions), and shared through the dealer app and as a shareable/exportable format (e.g. PDF) for WhatsApp.

C.14.2 Price-List Formats

Price-list formats are produced for sharing with dealers, presenting the applicable dealer price list (Standard / Dealer / Master Dealer) and, where required, MRP. As with the catalog, price lists are dealer-scoped so a dealer sees only their applicable prices and permitted items.

Development note — customisation required

Dealer-scoped catalog and price-list print/export formats (with the image set and price-inclusive / price-exclusive variants) are custom Print Formats / portal views driven by the dealer's issued-sample list and price classification.

Part D — Data Structures (Custom Doctypes)

This part specifies the custom, non-ERPNext document types. ERPNext-native doctypes are reused where possible (D.1). Field types follow Frappe conventions (Data, Link, Select, Int, Float, Currency, Percent, Date, Datetime, Check, Attach, Table, Text, Small Text). Child tables are listed under their parent.

D.1 ERPNext-Native Doctypes (Reused, with Customisation)

ERPNext Doctype	Customisation for Pacific Inc
Item	Link to Series; auto-populate attributes/price/bulk-retail thresholds on series select; item-level colour, base colour, finish, status; child tables for Image Gallery and Customer Part Number (dealer codes); batch variable weight; weight shown on print formats.
Customer (Dealer)	Price classification, dealer type, turnover band, location (in/out Bangalore), assigned salesperson, sample-issued catalog scope.
Payment Terms / Payment Terms Template	Used as-is for dealer payment policy (credit vs advance); linked at dealer level.
Supplier	GPS coordinates, factory location, insurance-holder reference, is-transporter flag.
Warehouse / Batch	Single Bangalore warehouse; batch-level variable weight and date of manufacturing.
Quotation	Per-item price working (child), retail markup, with/without GST & transport bifurcation, weight display.
Sales Order	From customer PO; mandatory item-wise delivery date; reservation; drop-ship flag; supplier vs customer timeline; weight display.
Purchase Order / Receipt	Material-ready status, pickup fields, shortage/damage capture, QR generation at receipt, batch weight.
Delivery Note / Sales Invoice	Bill-to/ship-to, drop-ship, auto e-Way bill, weight display.
Payment Entry	Advance capture, India Banking (VALS API) real-time reflection, dispatch-release trigger.
Stock Entry	Bay-to-bay movement with traceability and weight.
Price List / UOM	Three dealer price lists; Box primary UOM with Pieces / Sq Ft / Sq Metre and weight conversions.

D.2 Master Doctypes (Custom)

Series (master — attribute + price + bulk/retail)

The central master. One series yields 20–25 items and pre-sets attributes, pricing and bulk/retail thresholds.

Field	Type	Req.	Notes
series_name / series_code	Data	Yes	Name and unique code.
supplier	Link (Supplier)	Yes	Manufacturer / company.

Field	Type	Req.	Notes
item_group	Link	No	Brand / grouping.
size	Link/Select	Yes	e.g. 600×600. A change = new series.
thickness	Select	Yes	e.g. 5/9/12/15/16/20 mm. A change = new series.
finish / sub_finish	Link	Yes / No	Matt/Glossy → rocker, carving, stone-art, GVT/PGVT.
pieces_per_box	Int	Yes	Conversion basis.
weight_per_tile / weight_per_box	Float	Yes	Standard weights (kg); batch weight overrides at inward.
height_mm / width_mm / sqft_per_box	Float	Yes/No	Dimensions and derived area.
uom_conversions	Table	Yes	Box→Pieces/Sqft/Sqm and weight.
bulk_qty_threshold	Int	Yes	At/above this (per size) a sale is bulk.
retail_qty_threshold	Int	No	Retail band basis.
annual_sales_threshold_box	Int	No	Configurable withdrawal (PDC) threshold.
reorder_frequency	Select	No	Reorder cadence.
status	Select	Yes	Active / PDC / Against Order / Discontinued.
basic_rate_per_box	Currency	Yes	Price section.
insurance_pct / freight / loading	Percent/Currency	No	Landed-cost components.
margin_pct	Percent	Yes	Series margin.
price_list_rates	Table	Yes	Standard / Dealer / Master Dealer rates.
mrp	Currency	No	For price-inclusive catalog.

Transporter (master (+ Vehicle child))

Transporters and the Morbi→Bengaluru full-load fleet for pickup/route planning.

Field	Type	Req.	Notes
transporter_name	Data	Yes	Transporter / agency.
contact	Data	No	Contact details.
vehicles	Table (Vehicle)	Yes	Child table (below).

Vehicle child table:

Field	Type	Req.	Notes
owner_name	Data	No	Vehicle owner.
vehicle_number	Data	Yes	Registration number.
vehicle_type	Data	Yes	e.g. Truck / Container.

Field	Type	Req.	Notes
mode	Select	Yes	Road / Rail+Road / Ship+Road.
capacity_tonnes	Float	Yes	Full-load capacity (see C.1.7 fleet: 43.5/42/41/40.5/35/31/25 T trucks; 32.5/31 T rail containers; 28/31 T ship containers).
transit_days	Int	No	Indicative transit time.
standard_rate_basis	Currency/Data	No	Largely standard by vehicle type.
driver_name / driver_mobile	Data	No	Assigned on a pickup plan.

Warehouse Bay (master)

Bay layout and capacity for the Bangalore warehouse.

Field	Type	Req.	Notes
bay_code / bay_name	Data	Yes/No	Identifier and readable name.
warehouse	Link (Warehouse)	Yes	Parent warehouse.
bay_type	Select	Yes	Main / Buffer / Damage / Insurance Claim / Display / Blocked.
bay_size	Select/Data	No	e.g. 36×6, 36×8, 32×6, 32×8 ft (area).
capacity / current_occupancy / available_space	Float	No	Capacity management.
suitable_category	Link/Data	No	Product type best suited.
linked_main_bay	Link (Warehouse Bay)	No	Buffer→main association.
status	Select	Yes	Active / Blocked / Reserved.

D.3 Transactional Doctypes (Custom)

Dealer Inquiry (transactional (+ Item child))

Structured CRM inquiry; closes on PO linkage.

Field	Type	Req.	Notes
inquiry_no / inquiry_date	Data/Date	Yes	Reference and date.
dealer	Link (Customer)	Yes	Inquiring dealer.
source	Select	Yes	Phone / WhatsApp / App / Internal.
salesperson	Link (User)	No	Assigned owner.
status	Select	Yes	Open ... Converted / Mapped to PO / Rejected / Closed.
follow_up_date / reminders_sent	Date/Int	No	Follow-up (WhatsApp) tracking.
duplicate_flag	Check	No	Set by duplicate detection.

Field	Type	Req.	Notes
linked_customer_po / linked_sales_order	Data/Link	No	PO closes the inquiry; SO on conversion.
closure_reason	Select/Text	No	Reason if dropped.
items	Table (Inquiry Item)	Yes	Child: item, matched_code, image, req_qty, availability_status, alt_item, missed_demand_value.

Bay Allocation Slip (transactional (+ Item child))

Produced before unloading; confirmed by warehouse.

Field	Type	Req.	Notes
slip_no / reference_doc	Data/Link	Yes	Reference and source receipt/order.
warehouse_person	Link (User)	No	Responsible.
confirmation_status	Select	Yes	Suggested / Confirmed / Modified.
items	Table	Yes	Child: item, batch, qty, weight, suggested_bay, alternate_bay, buffer_bay.

Reorder Plan (transactional (+ Row child))

Auto-generated by scheduled job; purchase team reviews (review-only screen).

Field	Type	Req.	Notes
plan_date	Date	Yes	Run date.
supplier_filter / item_group_filter	Link	No	Scope filters.
generated_by_job	Check	No	Marks system-generated rows.
rows	Table (Reorder Row)	Yes	Child fields below.
— item	Link (Item)	Yes	Stock item.
— avg_sales	Float	No	Retail sales 3–6 mo (bulk excluded).
— current_stock / reserved / transit / pending / missed_demand	Float	No	Availability & demand.
— moq / suggested_qty	Int/Float	No	MOQ and auto-suggested qty (rounded up to 5).
— reorder_frequency / last_purchase_date / lead_time / status	Mixed	No	Planning context.

Pickup / Route Plan (transactional (+ Stop child))

Supplier pickup sequencing and vehicle planning.

Field	Type	Req.	Notes
plan_no / plan_date	Data/Date	Yes	Reference and date.
transporter / vehicle_type	Link/Select	No	From Transporter master.
capacity_tonnes	Float	No	From selected vehicle.
optimization_mode	Select	No	Time / Distance (both offered).
total_boxes / total_weight / remaining_capacity	Float	No	Load rollups; overload warning.
stops	Table (Pickup Stop)	Yes	Child: sequence, supplier, gps, po_ref, ready_qty, picked_qty, weight, arrival_time, departure_time, dwell_time, contact, remarks.

Claim Voucher (transactional (+ Item child))

Damage / insurance / shortage claim with settlement.

Field	Type	Req.	Notes
voucher_no / claim_type	Data/Select	Yes	Transit / Shortage / Insurance.
supplier	Link (Supplier)	Yes	Grouping is supplier-wise.
claimed / approved / received_amount / net_loss	Currency	No	Settlement figures.
settlement_mode	Select	No	Insurance / Vendor Credit Note / Partial / Write-off.
linked_credit_note	Link	No	On settlement.
accounting_status	Select	No	Held / Reconciled (31-Mar/01-Apr) / Cancelled.
documents	Attach	No	Supporting docs.
items	Table	Yes	Child: item, batch, qty, value, invoice/consignment ref.

Unloading Payment Voucher (transactional)

LR-wise unloading / labour payment.

Field	Type	Req.	Notes
voucher_no / lr_number	Data	Yes	Reference and consignment LR.
reference_doc	Link (PR)	No	Linked receipt.
labour_vendor / amount	Data/Currency	Yes	Payee and amount.
payment_mode	Select	Yes	PhonePe / GPay / UPI / NEFT / Bank / Cash.
status / txn_ref	Select/Data	Yes/No	Paid / Unpaid; UPI/bank reference.
paid_by / payment_date / attachment	Link/Date/Attach	No	Audit and proof.

Sample Request (transactional)

Sample approval and dealer-specific QR.

Field	Type	Req.	Notes
request_no	Data	Yes	Reference.
item / qty	Link/Float	Yes	Sample item and quantity.
dealer_location	Link (Customer)	Yes	Destination dealer/location.
requested_by / request_date	Link/Date	Yes	Origin.
approval_status / approver	Select/Link	Yes	Approval.
batch	Link (Batch)	No	Traceability (non-binding on sale).
sample_qr_code	Data	No	Dealer-specific unique code.

Display Placement Slip (transactional)

Auto-created on sample issue; triggers monitoring clock.

Field	Type	Req.	Notes
slip_no / source_invoice	Data/Link	Yes/No	Reference; captured from invoice/movement.
item / dealer_location / display_qty	Link/Float	Yes	Design, location, quantity.
placement_date	Date	Yes	Monitoring trigger.
condition / status / photo	Select/Attach	No	For reconciliation.

Sample Display Reconciliation (transactional)

Reconciles sample/display stock held at dealer locations.

Field	Type	Req.	Notes
recon_no / recon_date	Data/Date	Yes	Reference and cycle date.
placement_slip	Link (Display Placement Slip)	Yes	Source display.
dealer_location / item	Link	Yes	Where and what.
response	Select	Yes	Still displayed / Removed / Loose-not-shown.
responded_via / responded_by	Select/Link	No	WhatsApp button / staff.
action	Select	No	Keep / Put-up replacement / Pullback.
remarks	Small Text	No	Notes.

Override Approval (transactional (log))

Backs the submit-freeze approval workflow.

Field	Type	Req.	Notes
reference_doctype / reference_name	Dynamic Link	Yes	Document under approval.
override_type	Select	Yes	Credit limit / Overdue / Price / Discount / Amend / Cancel.
old_value / new_value	Data	No	Version diff.
requested_by / approver / status	Link/Select	Yes	Parties and outcome.
channels_notified	Select/Data	No	WhatsApp / Email / App / SMS.

Vehicle Tracking Log (transactional (+ Ping/Stop child))

Holds live location pings and stop events for a pickup plan.

Field	Type	Req.	Notes
pickup_plan	Link (Pickup / Route Plan)	Yes	Trip being tracked.
vehicle_number	Data	Yes	Truck on the trip.
current_location	Data/Geolocation	No	Latest known location.
events	Table (Stop Event)	No	Child: supplier, arrival_time, departure_time, dwell_time, picked_qty, weight.
last_updated	Datetime	No	Last ping time.

Labour Attendance & Payment (transactional (+ Attendance child))

Tracks labourer attendance and payment; links to unloading where relevant.

Field	Type	Req.	Notes
labourer	Data/Link	Yes	Labourer (name / master reference).
period_from / period_to	Date	No	Attendance period.
attendance	Table (Attendance Line)	No	Child: date, shift, present, work_type, linked_unloading_voucher.
days_present / amount_due / amount_paid	Float/Currency	No	Computed dues and payment.
payment_mode / txn_ref / payment_date	Select/Data/Date	No	How and when paid.
status	Select	No	Pending / Partly paid / Paid.

Unallocated Stock Entry (transactional)

Loose stock kept outside an allocated bay (C.6.6).

Field	Type	Req.	Notes
item / batch / qty	Link/Float	Yes	What and how much.
ad_hoc_location	Data	Yes	Where it was placed (scanned/space-tag).
recorded_by / recorded_on	Link/Datetime	No	Audit.
action	Select	No	Pending / Allocated to bay / Merged.
bay_allocation_slip	Link	No	On allocation.

D.4 Item Child Tables (Custom)

Product Image Gallery (child of Item)

Image set per item (used by catalog, dealer app, WhatsApp).

Field	Type	Req.	Notes
image	Attach Image	Yes	Image file.
image_type	Select	Yes	Product / Application (room) / Single Tile / Live / Additional.
is_primary	Check	No	Primary display image.
source / uploaded_by / uploaded_on	Data/Link/Datetime	No	Live images only from authorised registered mobile numbers; bulk images from Google Drive.

Customer Part Number (Dealer Code) (child of Item)

Dealer-specific code mapping; enables search by dealer's own code.

Field	Type	Req.	Notes
dealer	Link (Customer)	Yes	Dealer.
customer_item_code	Data	Yes	Dealer's code (reverse-mapped on inquiry / app / WhatsApp).
sample_issued	Check	No	Gates catalog visibility for the dealer.
remarks	Data	No	Notes.

D.5 Custom Workflows, Automations & Print Formats

The following are custom (server scripts, scheduled jobs, workflows, portal/print components) required beyond ERPNext defaults.

Custom component	Purpose
Series → Item propagation	Copy series attributes, price and bulk/retail thresholds to new items.
Code resolver service	Resolve dealer code / company code / image to internal item within issued-sample scope.
Duplicate inquiry / PO detection	Flag repeats within the configurable window.(Timeline - 48hrs)

Custom component	Purpose
Missed-demand aggregation	Aggregate unmet inquiries into reorder suggestions.
Reorder auto-calc (scheduled)	Generate the review-only Reorder Plan from retail sales and stock.
Bay-allocation algorithm	Suggest bay by category/batch/size/occupancy/buffer; produce slip.
QR / sticker print + batch print	Box and sample sticker formats; per-box print run.
Warehouse scanning validation	Inward/pick/dispatch scan-validate-confirm mobile UI.
Dispatch payment lock	Block dispatch until advance confirmed via VALS API.
Supplier-delay impact check	Compare supplier vs customer timeline, escalate/notify.
Sample placement monitoring (scheduled)	Auto-create placement slip, reminders, reconciliation.
Product withdrawal batch job (daily)	Active→PDC→Against Order→Discontinued transitions and triggers.
WhatsApp flow engine	Menu/code/image resolution, templates, buttons, reminders (dealer & staff).
Dealer app portal	Dealer-scoped catalog, enquiry-to-order, status/dues/history.
Catalog & price-list formats	Dealer-scoped, image-rich, price-inclusive/exclusive.
Image bulk import	Google Drive filename→item-code matching into image gallery.
OCR customer-PO ingestion	Extract PO/items/qty; confirm-on-mismatch.
e-Way bill automation	Pin-code distance → auto-generate for interstate/threshold.
Approval routing & notifications	Six override triggers, amend/cancel version diff, multi-channel.
Inquiry price derivation	Select price list by dealer classification + purchase history at quote time.
Batch-combination suggestion	Suggest single batch, else a 2–3 batch combination meeting the required qty.
Vehicle tracking + stop capture	Live location, per-stop pickup and dwell-time capture; driver route sharing.
Loose / unallocated stock tracking	Scan-and-record loose stock; unallocated report; allocate/merge flow.
Reorder review notification	Notify responsible members to review the auto-generated draft plan.
Labour attendance & payment	Track labourer attendance and dues/payments.

Part E — Integrations

Integration	Technical Notes
WhatsApp / Meta	Business messaging with controlled menus, approved templates and response buttons; reminders to dealers and staff. Depends on Meta approvals.
India Banking (VALS API)	ERPNext-integrated bank transfer and real-time transaction reflection, enabling advance verification and dispatch release. Only available India Banking Application functionality is provided; automatic payout bank charges out of scope.
GST & e-Way Bill API	GST-compliant invoicing and automatic e-Way bill generation from pin-code distance.
Maps / Routing API	Supplier GPS capture and route optimisation by time and by distance (both options). Real-time traffic and toll preference not decision factors.
OCR / AI (customer PO)	Extraction of PO number, items and quantities; confirm-on-mismatch. Supplier document reading subject to feasibility.
Google Drive	Bulk image import; filenames follow an item-code + image-type convention for matching.
AI Image Search & Recommendation	Wave 2. Accuracy depends on image quality and tagging.

Part F — Implementation Approach

Phase 1 is delivered in two waves and structured around four milestones. An operational go-live can follow Wave 1, with Wave 2 assisted-intelligence features continuing under Phase 1.

Figure 16 — Phased implementation roadmap

F.1 Milestones (Scope)

Milestone	Scope Covered
Milestone 1	Project confirmation, kickoff, solution design, master templates, user/role planning, Tally data review.
Milestone 2	Core system setup, master migration, dealer/item/supplier setup, inquiry workflow, pricing, purchase reorder planning.
Milestone 3	Warehouse bay allocation, QR/scanning, purchase pickup planning, damage/insurance workflow, unloading payment tracking, WhatsApp dealer flow, dealer app.
Milestone 4	Assisted AI image search, product recommendation, route/truck planning, forecasting, dashboards, UAT, training and go-live.

F.2 Delivery Waves

Wave 1 — Operational Backbone

Core system setup; Tally data migration; masters (Series, Item, Dealer, Supplier, Transporter, Warehouse & Bay); dealer inquiry workflow; product catalog and images; pricing; purchase reorder planning; purchase pickup planning; warehouse bay management and mobile scanning; QR/sticker printing; damage and insurance workflow; unloading payment tracking; web-based dealer app; WhatsApp dealer interaction; reports and dashboards; UAT and operational go-live.

Wave 2 — Assisted Intelligence & Optimisation

Assisted AI image search; assisted AI product recommendation; assisted route planning and truck-capacity planning; assisted forecasting; stock-clearance suggestions; display-replacement intelligence.

F.3 Data Migration

Source system is Tally Prime Edition 7.1. Scope covers the current year plus one prior year, subject to data availability and a clean exportable format. A sample export is validated first, then masters and transactions are mapped, cleaned, validated and imported.

Figure 17 — Tally data migration flow

F.3.1 Migration Scope

- Masters: dealer/customer, supplier, item/product (with series mapping).
- Opening stock and opening balances.
- Outstanding receivables and payables.
- Historical sales and purchase transactions for the current year plus one prior year, where available in clean export format.

F.3.2 Key Migration Steps

1. Validate a sample export first to confirm structure and field availability.
2. Normalise UOM: convert Tally's "box of N pieces" units to a single Box UOM plus a conversion factor; carry weight and area conversions.
3. Map dealer codes to company item codes (bulk templates for key dealers) so both codes resolve post-migration.
4. Map items to the new Series structure where possible.
5. Clean, de-duplicate and reconcile masters and balances before final import.
6. Import masters, then opening stock/balances/outstandings, then transactions; reconcile and sign off.

F.3.3 Customised Tally Fields to Migrate

Pacific Inc's Tally is customised; the following custom/derived fields must be captured and mapped (not just standard Tally masters):

Tally custom / derived data	Target in ERPNext
Customised unit "box of N pieces" and conversion	Item UOM = Box + conversion factor (pieces/box); Sq Ft and Sq Metre conversions.
Item attributes embedded in item name/series (size, thickness, finish, series)	Item attribute fields + Series master.
Retail vs bulk / display / sample classification	Series bulk/retail thresholds + invoice classification tag.
Reorder screen parameters (avg sales basis, reorder frequency, minimum levels)	Reorder Plan configuration and item reorder frequency.
Dealer price classification and three price lists	Customer classification + three ERPNext Price Lists.
Batch with date of manufacturing and variable weight	Batch + custom batch weight field.
Damage / breakage records captured at sale or purchase	Damage/claim references (opening position).
Dealer-specific product codes	Item Customer Part Number child table.
Migration dependency	

Tally custom / derived data	Target in ERPNext
Depth and completeness of historical migration depend on the cleanliness and exportability of the Tally data. Cleaning beyond the agreed templates is handled separately.	

F.4 ERPNext Customisation Plan

The build is delivered as an ERPNext app for Pacific Inc containing the custom doctypes, fields, workflows, scripts, jobs, print formats, portal pages and integrations. Summary of what is configured vs custom-developed:

Layer	What is built
Custom doctypes	Series, Transporter (+Vehicle), Warehouse Bay, Dealer Inquiry (+Item), Bay Allocation Slip, Reorder Plan (+Row), Pickup/Route Plan (+Stop), Vehicle Tracking Log, Claim Voucher (+Item), Unloading Payment Voucher, Labour Attendance & Payment, Sample Request, Display Placement Slip, Sample Display Reconciliation, Unallocated Stock Entry, Override Approval; Item child tables (Image Gallery, Customer Part Number).
Custom fields on native doctypes	Supplier GPS; Item series link, colour/finish/status, batch weight; Customer classification/type/scope; transaction weight display and drop-ship flags.
Scheduled jobs	Reorder auto-calc; product-withdrawal daily job; sample placement monitoring/reminders; supplier-delay impact check.
Server / client scripts	Series→Item propagation; code resolver; duplicate detection; bay-allocation suggestion; dispatch payment lock; e-Way bill trigger; price working calculations.
Workflows	Submit-freeze with six override triggers; amend/cancel version-diff routing; approvals with mobile + multi-channel notification.
Print formats	Box/inward sticker, dealer sample sticker, dealer catalog (image-rich, price-inclusive/exclusive), dealer price list, key transaction formats with weight.
Portal & channels	Web dealer app (portal); WhatsApp flow engine + middleware; warehouse mobile scanning UI.
Integrations	India Banking (VALS API), GST/e-Way, Maps/Routing, OCR/AI, Google Drive image import, WhatsApp/Meta.
Reports & dashboards	The report set in C.12.2 and role dashboards; Wave 2 assisted-AI features.

F.5 Implementation Steps

Indicative sequence; Wave 1 modules are built and rolled out first, with Wave 2 following.

Figure 18 — Implementation steps

7. Environment & instance setup: cloud hosting, ERPNext instance, custom app skeleton, middleware and dealer-app scaffolding.
8. Masters & configuration: Series, Item, Dealer, Supplier (GPS), Transporter & Vehicle, Warehouse & Bay, price lists, UOM/weight conversions, roles and permissions, payment terms.
9. Tally data migration: sample validation, UOM normalisation, dealer-code mapping, custom-field mapping, clean/validate/import (current + last year).
10. Custom doctypes & workflows: inquiry/CRM, reorder plan, bay allocation, claim voucher, unloading, sample/display, approvals.
11. Channel build: WhatsApp flow (templates, buttons, reminders), web dealer app enquiry module, warehouse mobile scanning.
12. Integrations: India Banking (VALS API), GST/e-Way bill, Maps/Routing, OCR customer-PO, Google Drive image import.
13. Print formats and reports/dashboards: stickers, catalog, price list; report set and role dashboards.
14. UAT, training and a full mock run of the end-to-end flows.
15. Wave 1 operational go-live.
16. Wave 2: assisted AI image search and recommendation, route/truck optimisation, forecasting.

F.6 Timeline & Dependencies

Indicative timeline: approximately 6 to 7 months

Depends on: final scope confirmation, Tally data quality, product-image availability, WhatsApp/Meta approval timelines, PDA/scanner hardware testing, user availability for testing, and timely approvals from Pacific Inc.

F.7 Assumptions & Exclusions (Technical)

Assumptions	Exclusions
~10 internal users for initial sizing (no hard cap).	Native iOS/Android app; offline mobile app.
~150 dealers via dealer app and WhatsApp.	Hardware procurement and warranty (PDA/scanners billed separately).
Current + one prior year Tally migration.	Product photography and manual image cleanup.
Product images provided item-code-wise by Pacific/vendors, or via Google Drive with the naming convention.	Data cleaning beyond agreed templates; migration beyond current + one year.
WhatsApp depends on Meta approvals; AI is assisted and image-quality dependent.	Enterprise-grade AI accuracy guarantee; marketplace/e-commerce integration.
Route/truck planning is assisted, not a fully automated logistics engine.	Direct banking integration other than the India Banking Application.

F.8 Success Factors

- Timely confirmation of scope and workflow approvals.
- Clean Tally data export and availability of product images (with the agreed naming convention).
- Clear internal process owners from Pacific Inc.
- Timely user testing and dedicated coordination during UAT.
- Hardware finalisation for PDA/scanning.
- Timely WhatsApp and template approvals.

F.9 Information Required from Client (Dependencies)

The following are needed from Pacific Inc to configure and build accurately. They are dependencies on the client and should be collected during Milestone 1.

Item required from client	Used for
GST and tax structure for items (HSN, GST rates, any tax categories).	Item tax setup, GST invoicing and e-Way bill.
Current series numbering scheme and the print formats presently used.	Series master design, item coding and print-format replication.
User list with their roles and access levels.	Role and permission configuration.

Item required from client	Used for
Bay size and bay-type list, and the warehouse design / layout and capacity.	Warehouse Bay master and bay-allocation logic (C.1.8 / C.6.3).
Dealer classification measurement basis (confirm period / rolling window for the sales bands).	Dealer classification automation (C.1.4).
Product images (item-code-wise) or Google Drive folder with the naming convention.	Catalog, dealer app, WhatsApp and image bulk-import.
Tally export (current + prior year) including customised fields.	Data migration (F.3).

Part G — Open Points & Configurable Values

The following were discussed as open or configurable and should be finalised during solution design. They are treated as configurable parameters; indicative values are starting points only.

Open Point	To Confirm / Configure
Dealer classification bands	Confirmed (configurable): <₹1L Standard, ≥₹1L Dealer, ≥₹15L Master Dealer; confirm the measurement period / rolling window.
Insurance %	Configurable per series.
Bulk / retail thresholds	Per-series bulk and retail quantity thresholds (by size).
Duplicate-inquiry window	Configurable (48 hours starting default).
Missed-demand matching	Configurable quantity-variation threshold and match rules.
MOQ hierarchy	Company / vendor / production MOQ and applicability of the indicative 80-box figure.
Stock reservation review/release	Holding period before review; automatic vs approval-based release.
Supplier-delay escalation	Delay threshold that triggers customer-impact escalation.
Advance-payment rules	Advance percentages and dispatch-blocking conditions per dealer/item (via Payment Terms).
Dealer-facing batch visibility	Top-3 batch rule and single-batch handling.
Sample/display cycle	Monitoring cycle and reminder intervals; store-count criterion for withdrawal.
Product-withdrawal thresholds	Series-level annual sales threshold and display-duration / store-count criteria.
Route optimisation default	Both time and distance provided; confirm default preference.
OCR / image matching	Supported formats, minimum quality, confidence threshold and manual-verification flow; image filename convention.
Salesperson assignment	Salesperson-to-dealer assignment, targets and incentive rules.

— End of Document —
